Outline

1. Jetpack Compose Key Concepts
2. UI Components
3. Modifiers
4. Layouts
5. State

Jetpack Compose Key Concepts

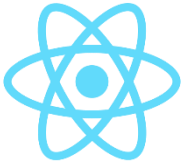
https://developer.android.com/jetpack/compose/mental-model

Declarative UI is a major trend

- Describe WHAT to see NOT HOW

Flutter: Google's UI toolkit for building natively compiled applications for mobile, web and desktop from a single codebase

SwiftUI: Apple’s new declarative framework for creating apps that run on iOS



React: A JavaScript library for building user interfaces

Jetpack Compose: a **modern toolkit** for building native Android UI (released July 2021)

Jetpack Compose

- Jetpack Compose is a **modern UI toolkit** for Android
  - It simplifies UI development with less code and intuitive Kotlin APIs that follow best practices
- A **declarative component-based programming model**
  - UI is built using composable functions
    - Each function define a piece the app's UI programmatically by **describing WHAT to see** (layout/ look and feel) **NOT HOW**
  - As state changes the UI automatically updates (Reactive UI)

(without imperatively mutating UI views)

  - Inspired by/similar to other declarative UI frameworks such as React and Flutter

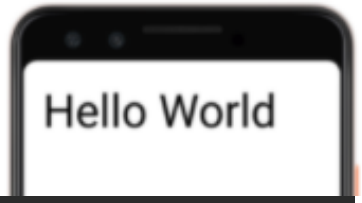
How to define a piece of UI?

- UI is **composed** of small reusable **components**
- UI Component = Composable **function**:
  - Just a function annotated with **@Composable**
  - Takes some inputs and emits a piece of UI
  - Describes the desired screen state (**WHAT to see)**
    - Compiler takes care of the HOW and constructs UI widgets
  - Converts the input data into UI

  - **UI = f(state) : UI is a visual representation of state**
    (e.g., display a tweet and associated comments)
  - **State changes trigger automatic update of the UI**

UI as a function

String → `fun Greeting(name: String) = println("Hello, $name")` → stdout

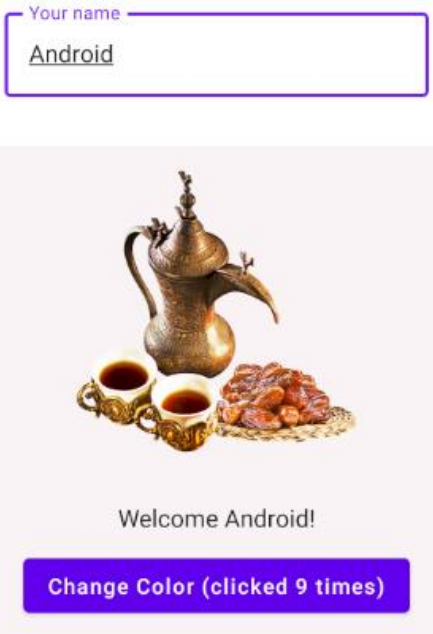


Mark as a composable

Data → `@Composable fun Greeting(name: String) = Text("Hello, $name")` → UI

Greeting function uses the input data to render a Text widget on the screen

UI = Composition of UI functions



- The top-level composable function describes the UI by calling other composables and passing them the appropriate data

```
@Composable
fun WelcomeScreen() {
    var userName by remember { mutableStateOf( value: "Android") }
    Column { this: ColumnScope
        NameEditor(name = userName, nameChange = { newName -> userName = newName })
        Welcome(userName)
    }
}

@Composable
fun NameEditor(name: String, nameChange: (String) -> Unit) {...}

@Composable
fun Welcome(name: String) {...}
```

Entry point to Compose world

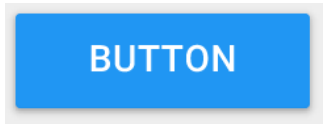
- When the app launches it creates and starts the *Main Activity*
- **Activity** acts as a container to load the **main UI screen** using **setContent** in the **onCreate** method

```
class MainActivity : ComponentActivity() {
    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)
        setContent {
            MyAppTheme {
                Surface(color = MaterialTheme.colors.background) {
                    Greeting("Android")
                }
            }
        }
    }
}

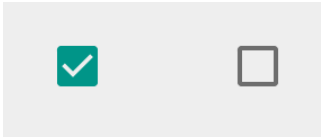
@Composable
fun Greeting(name: String) {
    Text(stringResource(R.string.hello, name))
}
```

UI Components

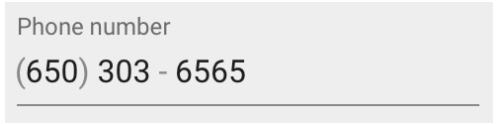
Button



CheckBox



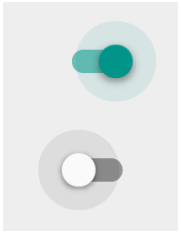
TextField

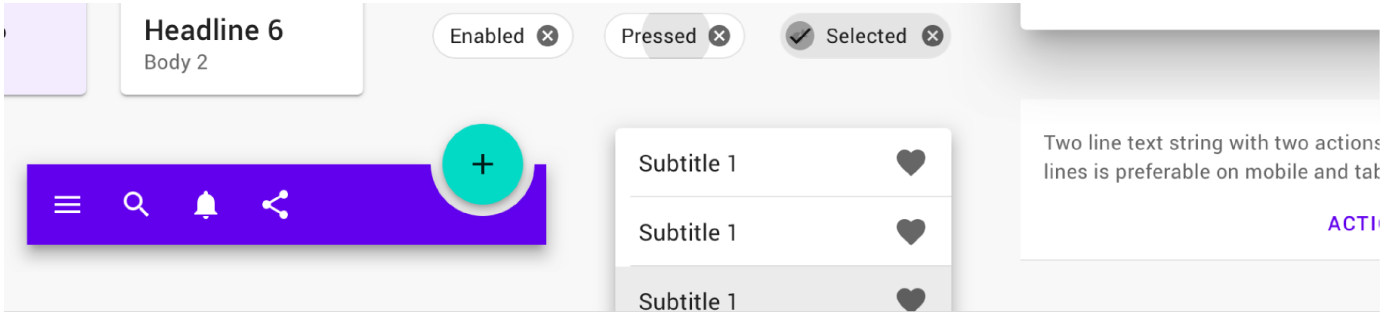


RadioButton

Slider

Switch





Back

Full list available at this link

Text box

```
@Composable
fun Number(value: Int) {
    Text(
        text = value.toString(),
        fontSize = 20.sp,
        modifier = Modifier
            .size(40.dp)
            .background(Color.Black)
    )
}
```

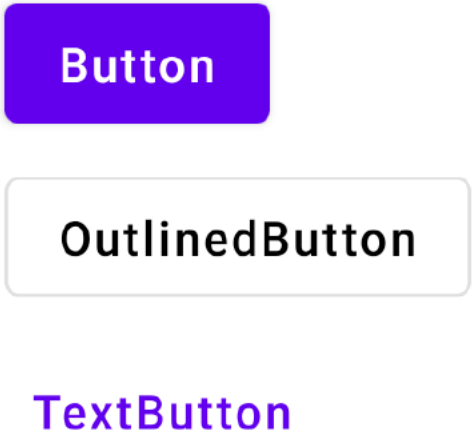
Button

```
Button(
    text = "Button",
    icon: Icon? = myIcon,
    textStyle = TextStyle(...),
    spacingBetweenIconAndText = 4.dp,
    ...
)
```

```
Button(onClick = {}) {
    Text("Button")
}

OutlinedButton(onClick = {}) {
    Text("OutlinedButton")
}

TextButton(onClick = {}) {
    Text("TextButton")
}
```

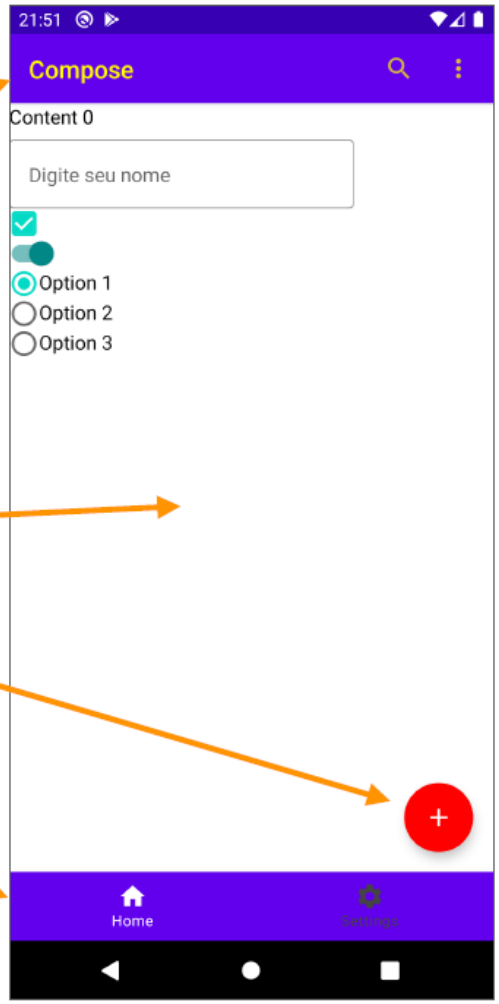


Image

```
Image(painter =
    painterResource(R.drawable.img_compose_logo),
    contentDescription = "Jetpack compose logo",
    modifier = Modifier.sizeIn(maxHeight = 300.dp))
```

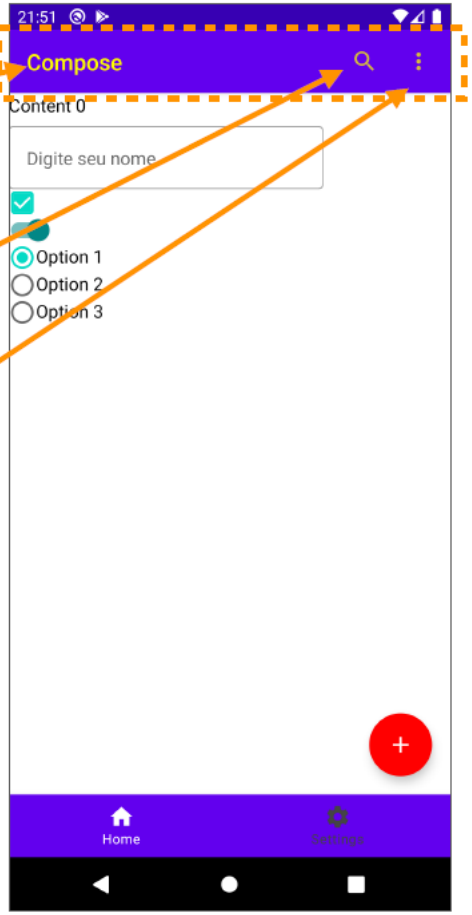
Scaffold

```
Scaffold(
    topBar = {...},
    floatingActionButton = {...},
    bottomBar = {...}
) {...}
```



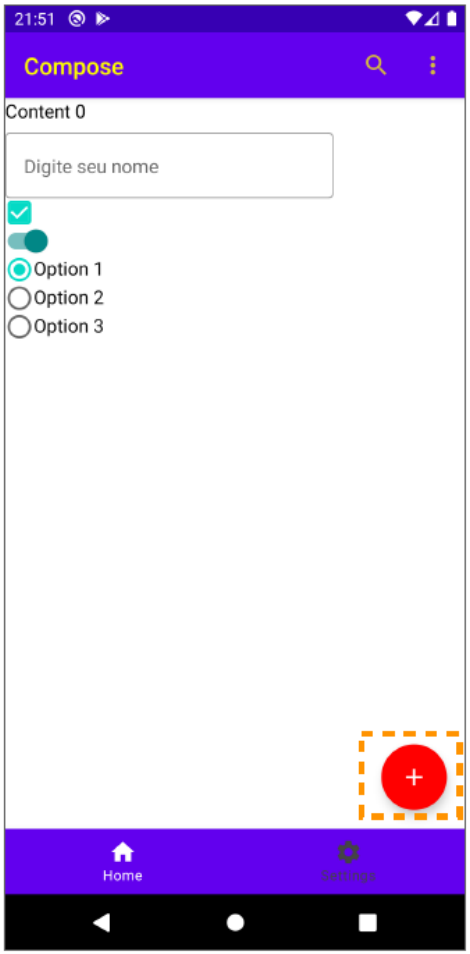
TopAppBar

```
TopAppBar(
    title = { Text(text = "Compose") },
    backgroundColor = MaterialTheme.colors.primary,
    contentColor = Color.Yellow,
    actions = {
        IconButton(onClick = {}) {
            Icon(Icons.Default.Search, "Search")
        }
        IconButton(
            onClick = { … }
        ) {
            Icon(Icons.Filled.MoreVert, "More")
            DropdownMenu(…)
        }
    }
)
```



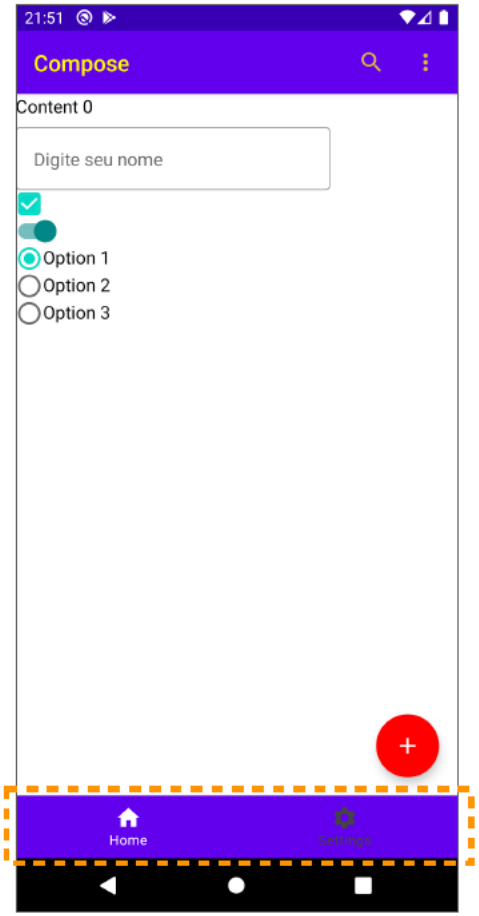
FloatingActionButton

```
FloatingActionButton(
    onClick = { … },
    backgroundColor = Color.Red,
    contentColor = Color.White
) {
    Icon(Icons.Filled.Add, "Add")
}
```



BottomAppBar

```
BottomAppBar(
    backgroundColor = MaterialTheme.colors.primary,
    content = {
        BottomNavigationItem(
            icon = { Icon(Icons.Filled.Home) },
            selected = selectedTab == 0,
            onClick = { selectedTab = 0 },
            selectedContentColor = Color.White,
            unselectedContentColor = Color.DarkGray,
            label = { Text(text = "Home") }
        )
        BottomNavigationItem(…)
    }
)
```



Material Design Components

- Using MDC to make your app look great easily

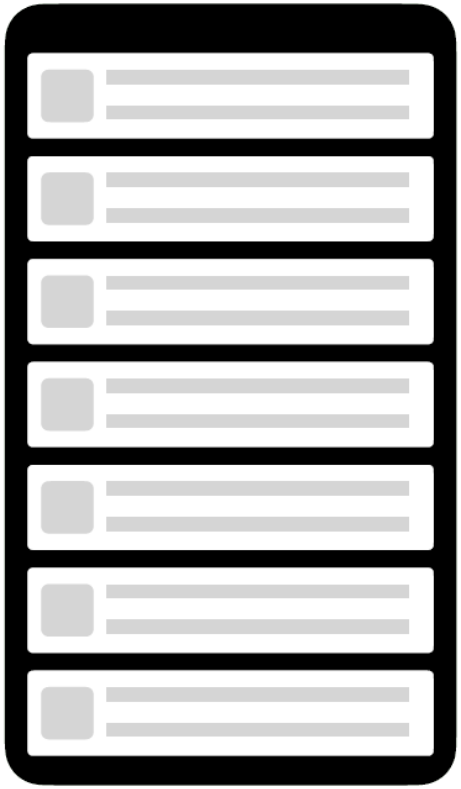
https://material.io/components

  - Float labels – TextInputLayout
  - FloatingActionButton
  - NavigationDrawer
  - Toolbar
  - CardView
  - TabLayout
  - BottomNavigation
  - BottomSheet
  - Snackbar

AlertDialog

- TBD

List



```
@Composable
fun SurahsList(surahs: List<Surah>) {
    Column(modifier =
     Modifier.verticalScroll(rememberScrollState())
    ) {
        if (surahs.isEmpty()) {
            Text("Loading surahs failed.")
        } else {
            surahs.forEach {
                SurahCard(surah = it)
            }
        }
    }
}
```

List in Compose (with index)

```
@Composable
fun UserListScreen(users: List<User>) {
    LazyColumn(
        modifier = Modifier.fillMaxSize()) {
        item {
            Text("Header",
                Modifier.fillMaxWidth().padding(8.dp)
            )
        }
        itemsIndexed(users) { index, user ->
            Text("${user.name} - ${user.age}",
                Modifier.fillMaxWidth().padding(8.dp)
            )
        }
    }
}
```

Modifiers

Modifiers

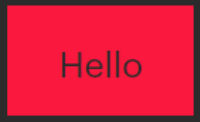
- Modifiers amend the look or behavior of UI components

e.g., provide **spacing**, **layout parameters** and **assign behavior** such as clickable

- They're chained and the order matters!
  - Applied in a sequential way and the order impacts the behavior

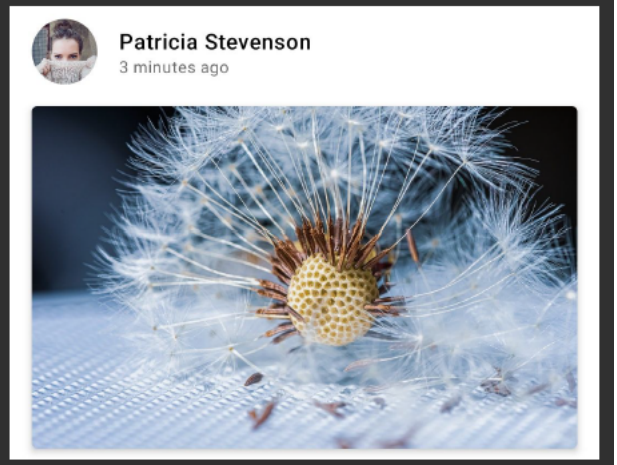
```
Text(
    text = "Hello",
    modifier = Modifier.padding(16.dp)
        .background(color = Color.Red)
)
```

```
Text(
    text = "Hello",
    modifier = Modifier.background(color = Color.Red)
        .padding(16.dp)
)
```



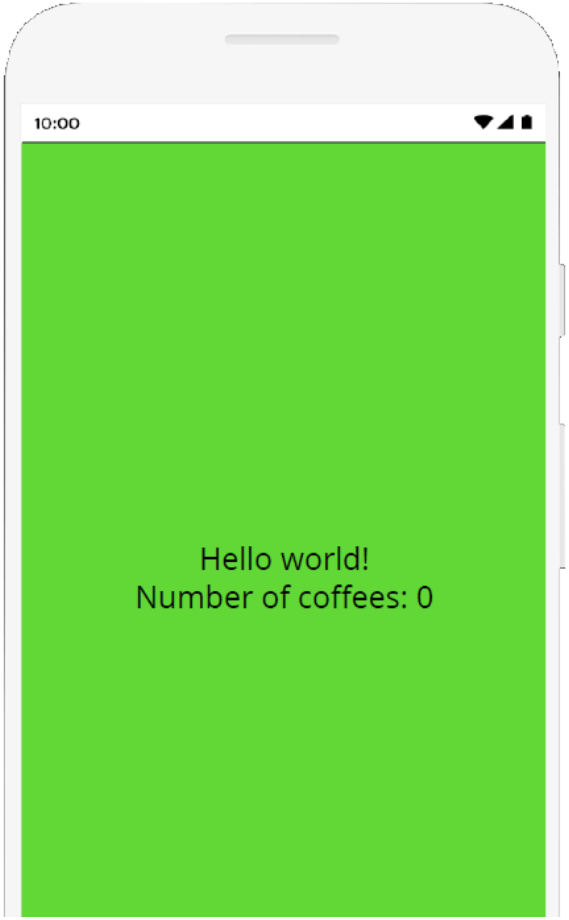
Photographer Card

```
@Composable
fun PhotographerCard(
    photographer: Photographer,
    onClick: () -> Unit
) {
    val padding = 16.dp
    Column(
        modifier
            .clickable(onClick = onClick)
            .padding(padding)
            .fillMaxWidth()
    ) {
        Row(verticalGravity = Alignment.CenterVertically) { …
}
        Spacer(Modifier.size(padding))
        Card(elevation = 4.dp) { … }
    }
}
```



Another Modifier Example

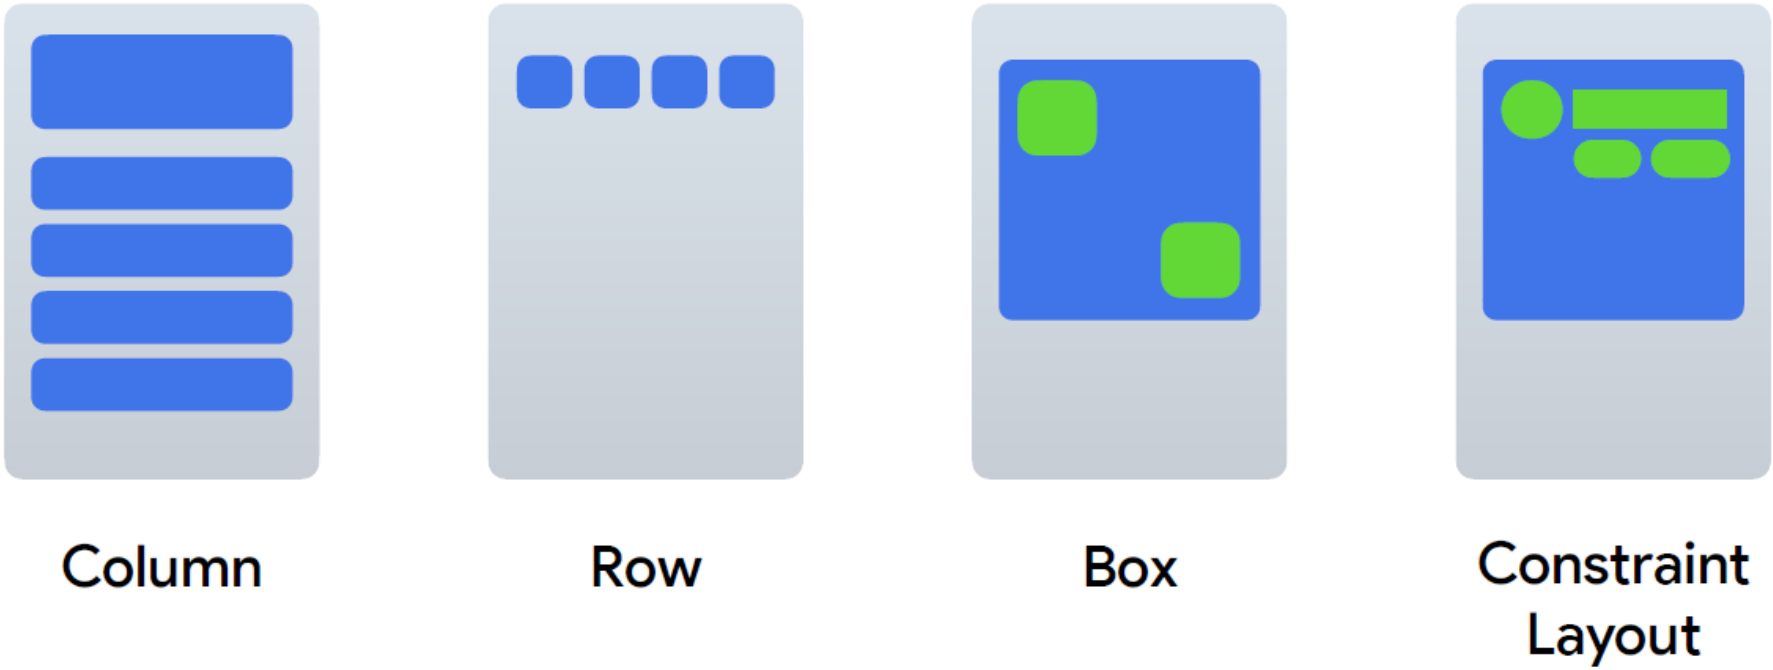
```
@Composable                                                    Kt
fun Greeting(name: String) {
  Column(
    modifier = Modifier.fillMaxSize()
                       .background(Color.Green)
                       .padding(16.dp),
    horizontalAlignment = Alignment.CenterHorizontally,
    verticalArrangement = Arrangement.Center
  ){
    Text(text = "Hello $name!")
    Text(text = "Number of coffees: 0")
  }
}
```



Layouts

Compose Layout

- Column = vertical orientation
- Row = horizontal orientation



Row & Column Example

```
@Composable
fun ArtistCard(artist: Artist) {
    Row(verticalAlignment = Alignment.CenterVertically) {
        Image(/*...*/)
        Column {
            Text(artist.name)
            Text(artist.lastSeenOnline)
        }
    }
}
```

Alfred Sisley
3 minutes ago

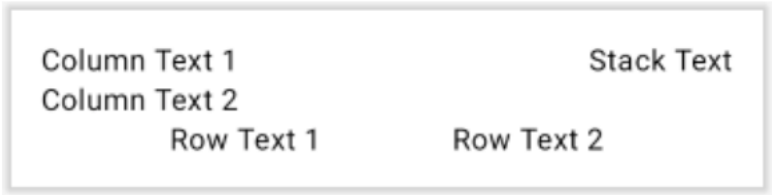
Box Example

```
@Composable
fun ArtistAvatar(artist: Artist) {
    Box {
        Image(/*...*/)
        Icon(/*...*/)
    }
}
```

Box Example (1 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {
    Column(
        modifier = Modifier
            .padding(16.dp)
            .fillMaxWidth()
    ) {
        Text("Column Text 1")
        Text("Column Text 2")

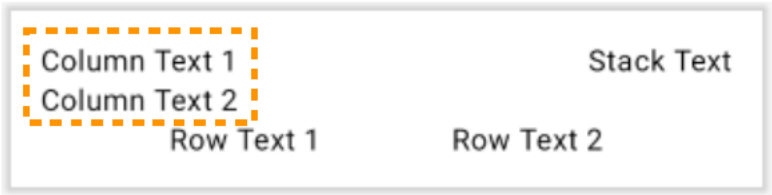
        Row(
            modifier = Modifier.fillMaxWidth(),
            horizontalArrangement = Arrangement.SpaceEvenly
        ) {
            Text(text = "Row Text 1")
            Text(text = "Row Text 2")
        }
    }
    Text(
        "Stack Text",
        modifier = Modifier
            .align(Alignment.TopEnd)
            .padding(end = 16.dp, top = 16.dp)
    )
}
```



Box Example (2 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {
    Column(
        modifier = Modifier
            .padding(16.dp)
            .fillMaxWidth()
    ) {
        Text("Column Text 1")
        Text("Column Text 2")

        Row(
            modifier = Modifier.fillMaxWidth(),
            horizontalArrangement = Arrangement.SpaceEvenly
        ) {
            Text(text = "Row Text 1")
            Text(text = "Row Text 2")
        }
    }
    Text(
        "Stack Text",
        modifier = Modifier
            .align(Alignment.TopEnd)
            .padding(end = 16.dp, top = 16.dp)
    )
}
```



Box Example (3 of 4)

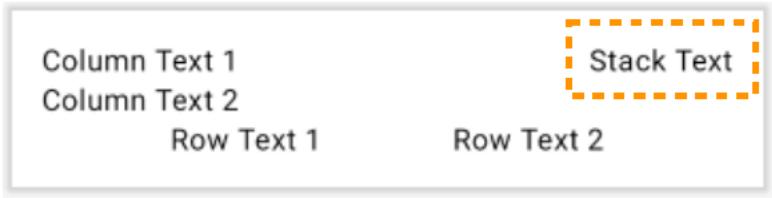
```
Box(modifier = Modifier.fillMaxWidth()) {
    Column(
        modifier = Modifier
            .padding(16.dp)
            .fillMaxWidth()
    ) {
        Text("Column Text 1")
        Text("Column Text 2")

        Row(
            modifier = Modifier.fillMaxWidth(),
            horizontalArrangement = Arrangement.SpaceEvenly
        ) {
            Text(text = "Row Text 1")
            Text(text = "Row Text 2")
        }
    }
    Text(
        "Stack Text",
        modifier = Modifier
            .align(Alignment.TopEnd)
            .padding(end = 16.dp, top = 16.dp)
    )
}
```

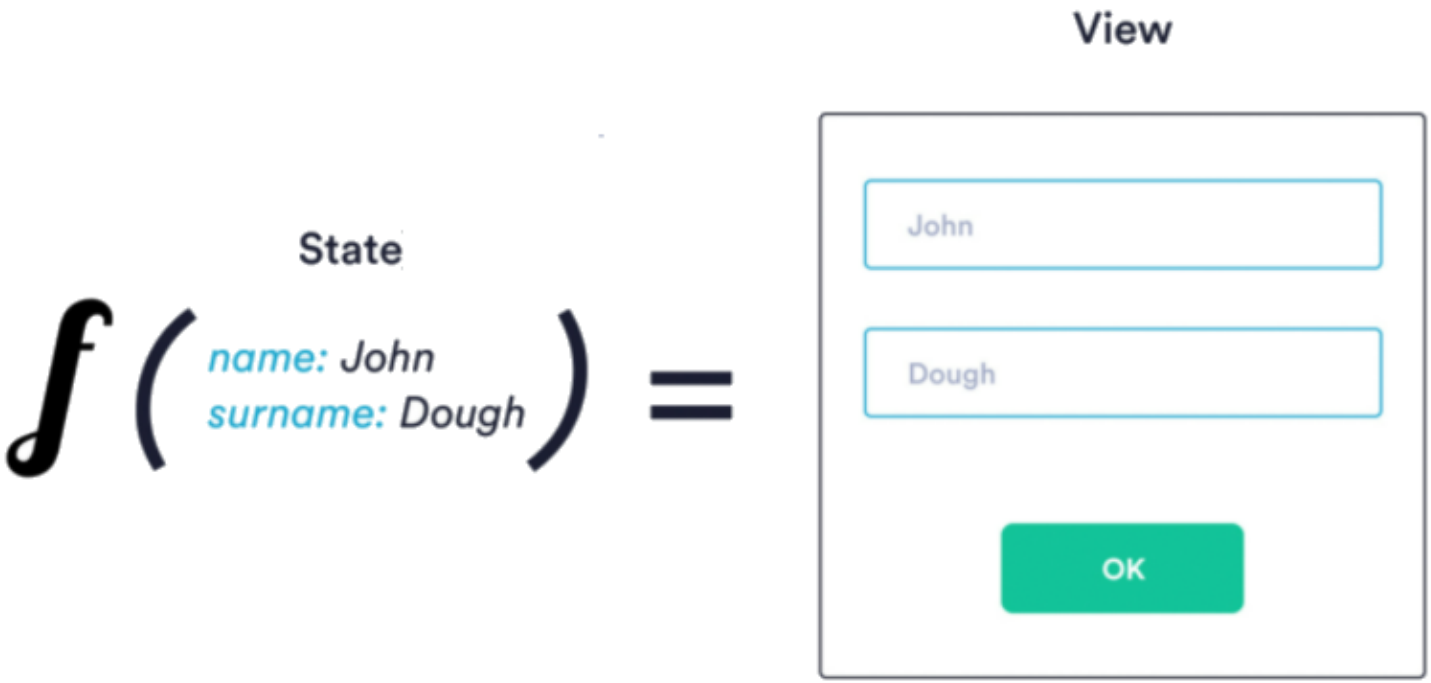
Box Example (4 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {
    Column(
        modifier = Modifier
            .padding(16.dp)
            .fillMaxWidth()
    ) {
        Text("Column Text 1")
        Text("Column Text 2")

        Row(
            modifier = Modifier.fillMaxWidth(),
            horizontalArrangement = Arrangement.SpaceEvenly
        ) {
            Text(text = "Row Text 1")
            Text(text = "Row Text 2")
        }
    }
    Text(
        "Stack Text",
        modifier = Modifier
            .align(Alignment.TopEnd)
            .padding(end = 16.dp, top = 16.dp)
    )
}
```



State



https://developer.android.com/jetpack/compose/state

State

- State = value that can change overtime
- State variable must be declared as

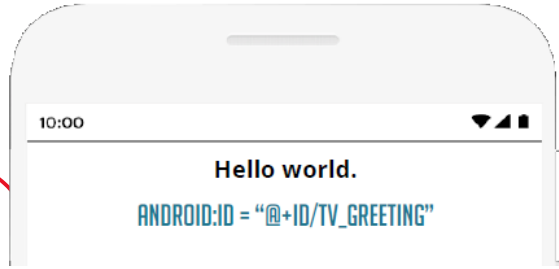
```
var stateVar by remember { mutableStateOf(default) }
```

- **Remember** is used to store the state variable in the composable memory during initial composition
  - the stored value is returned during recomposition
- State variable **are observed** by the Jetpack compose runtime
  - Any value changed in the state will trigger the recomposition of any composable functions that **read value**
  - Every place a state variable is displayed is guaranteed to be auto-updated

Imperative UI vs. Declarative UI

- Imperative UI – call a setter on the view to change its internal state

```
TextView greetings = (TextView) findViewById(R.id.tv_greeting)
greetings.text = "Hello world."
```



- UI in Compose is immutable
  - In compose you cannot access/update UI elements directly (as done in the imperative approach)
  - The only way to update the UI is by updating the state variable(s) used by the UI elements – this triggers automatic UI update
    - E.g., displayed ***greeting text*** can only be changed by updating the ***name*** state variable

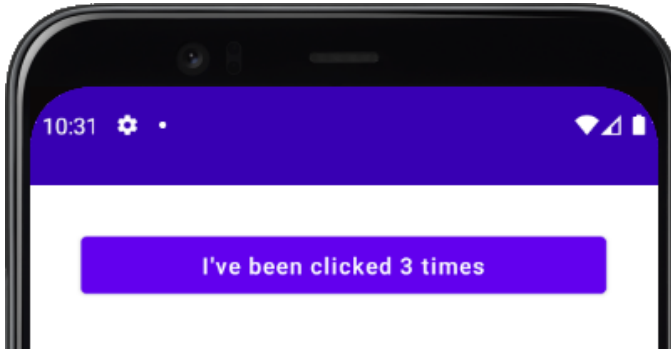
```
@Composable
fun WelcomeScreen() {
    var name by remember { mutableStateOf("Android") }
    Greeting(name)
}
```

```
@Composable
fun Greeting(name: String) {
  Text(text = "Hello $name!")
}
```

Recomposition

- When the user interacts with the UI, the UI raises events such as onClick
  - Those events should notify the app logic, which can then change the app's state
  - When the state changes it causes the composable functions to be automatically called again with the new data => this causes the UI elements to be redrawn
  - This process is called **recomposition**
- The Compose framework can intelligently recompose only the components that changed

Recomposition Example

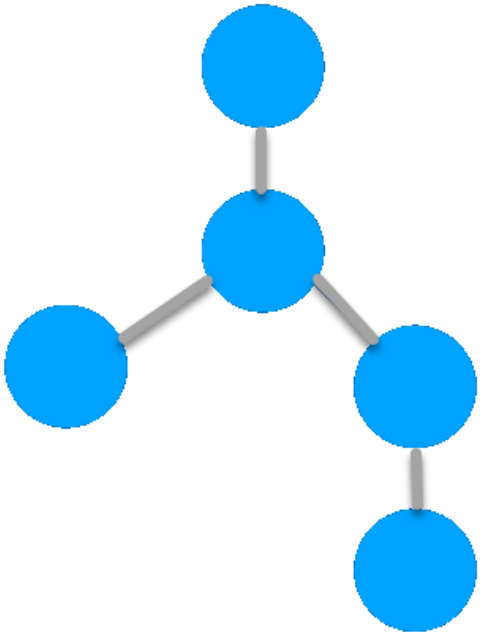


- Every time the button is clicked, the UI raises ***onClick*** event to notify the app logic, which increments **clicksCount** state variable
- This causes a **recomposition** to take place, i.e., the **ClickCounter** function is automatically called again to redrawn the Button

```
@Composable
fun MainScreen() {
    var clicksCount by remember { mutableStateOf(0) }
    ClickCounter(clicks = clicksCount, onClick = { clicksCount += 1 })
}
@Composable
fun ClickCounter(clicks: Int, onClick: () -> Unit) {
    Button(onClick = onClick) {
        Text("I've been clicked $clicks times")
    }
}
```

How recomposition works

1. Creates an abstract representation of the UI and renders it
2. When a change occurs, it creates a new representation
3. Computes the differences between the two representations
4. Renders the differences [if any]



For more details about Jetpack Compose Runtime, watch this video

Stateful versus stateless

- A stateful composable uses **remember** to store an object
  - However, stateful composable tend to be less reusable and harder to test
- A stateless composable that doesn't hold any state
  - The caller controls and manages the state
  - An easy way to achieve stateless is by using **state hoisting**

State Hoisting

- To make a composable stateless, **extract** its state and **move it to the caller** of the composable
- Then pass the state to the composable as an immutable parameter, along with functions as parameters to callback for handling **events** (e.g., onValueChange, onExpand and onCollapse)**:**
  - `name: String` - the current value to display
  - `onNameChange: (String) -> Unit` - an event that requests the value to change
- Hoisted state can be shared with multiple composables

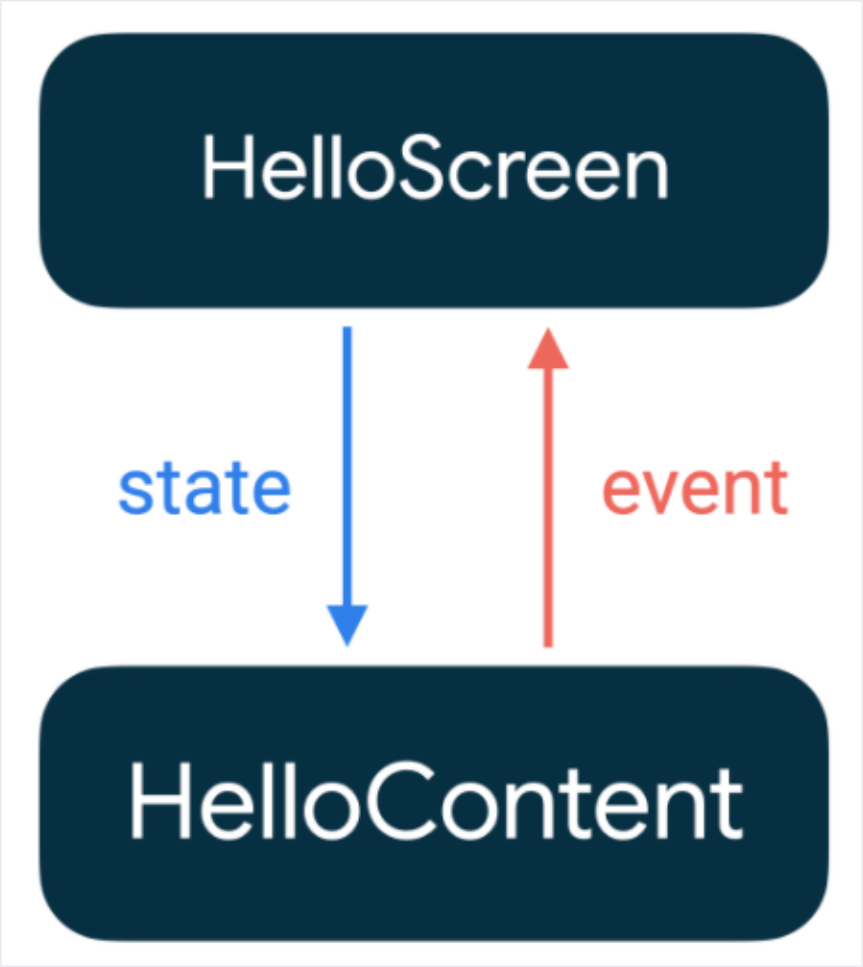
State Hoisting - Example

```
@Composable
fun HelloScreen() {
    var name by remember { mutableStateOf("") }

    HelloContent(name = name, onNameChange = { name = it })
}

@Composable
fun HelloContent(name: String, onNameChange: (String) -> Unit) {
    Column(modifier = Modifier.padding(16.dp)) {
        Text(
            text = "Hello, $name",
            modifier = Modifier.padding(bottom = 8.dp),
            style = MaterialTheme.typography.h5
        )
        OutlinedTextField(
            value = name,
            onValueChange = onNameChange,
            label = { Text("Name") }
        )
    }
}
```

Unidirectional Data Flow



State flows down via parameters

(i.e., name)

(State change) Events flow up via callbacks

(i.e., onNameChange)

By hoisting the state out of HelloContent, it can be **reused** in different situations, and it is easier to test

Summary

- Declarative UI is the trend for UI development
- UI is composed of small reusable components
- UI Component = Composable function
- UI in Compose is immutable
- It only accepts state & expose events
- Unidirectional data flow pattern:
  - State flows down via parameters
  - Events flow up via callbacks
