Outline

1. Jetpack Compose Key Concepts
2. UI Components
3. Modifiers
4. Layouts
5. State

Jetpack Compose Key Concepts

<https://developer.android.com/jetpack/compose/mental-model>

Declarative UI is a major trend

- Describe WHAT to see NOT HOW

Flutter: Google's UI toolkit for building natively compiled applications for mobile, web and desktop from a single codebase

SwiftUI: Apple's new declarative framework for creating apps that run on iOS

React: A JavaScript library for building user interfaces

Jetpack Compose: a **modern toolkit** for building native Android UI ([released July 2021](#))

Jetpack Compose

- Jetpack Compose is a **modern UI toolkit** for Android
 - It simplifies UI development with less code and intuitive Kotlin APIs that follow **best practices**
- **A declarative component-based programming model**
 - UI is built using composable functions
 - Each function define a piece the app's UI programmatically by **describing WHAT to see** (layout/ look and feel) **NOT HOW**
 - As state changes the UI automatically updates (Reactive UI) (without imperatively mutating UI views)
 - Inspired by/similar to other declarative UI frameworks such as React and Flutter

How to define a piece of UI?

- UI is **composed** of small reusable **components**
- UI Component = Composable **function**:
 - Just a function annotated with **@Composable**
 - Takes some inputs and emits a piece of UI
 - Describes the desired screen state (**WHAT to see**)
 - Compiler takes care of the HOW and constructs UI widgets
 - Converts the input data into UI

- **UI = f(state) : UI is a visual representation of state**
(e.g., display a tweet and associated comments)

- **State changes trigger automatic update of the UI**

UI as a function

String

```
fun Greeting(name: String) =  
    println("Hello, $name")
```

stdout

Mark as a composable

Data

```
@Composable  
fun Greeting(name: String) =  
    Text("Hello, $name")
```

UI

Greeting function uses the input data to render a Text widget on the screen

UI = Composition of UI functions

Your name

- The top-level composable function describes the UI by calling other composables and passing them the appropriate data

@Composable

```
fun WelcomeScreen() {  
    var userName by remember { mutableStateOf( value: "Android") }  
    Column { this: ColumnScope  
        | NameEditor(name = userName, nameChange = { newName -> userName = newName })  
        | Welcome(userName)  
    }  
}
```

@Composable

```
fun NameEditor(name: String, nameChange: (String) -> Unit) {...}
```

@Composable

```
fun Welcome(name: String) {...}
```

App Entry Point

- When the app launches it creates and starts the *Main Activity* (specified in *AndroidManifest.xml*)
- The **Activity** acts as a container to load the UI main screen using **setContent** in the **onCreate** method

```
class MainActivity : AppCompatActivity() {  
    override fun onCreate(savedInstanceState: Bundle?) {  
        super.onCreate(savedInstanceState)  
        setContent {  
            MyAppTheme {  
                Surface(color = MaterialTheme.colors.background) {  
                    Greeting("Android")  
                }  
            }  
        }  
    }  
}  
  
@Composable  
fun Greeting(name: String) {  
    Text(stringResource(R.string.hello, name))  
}
```

UI Components

Button

CheckBox

TextField

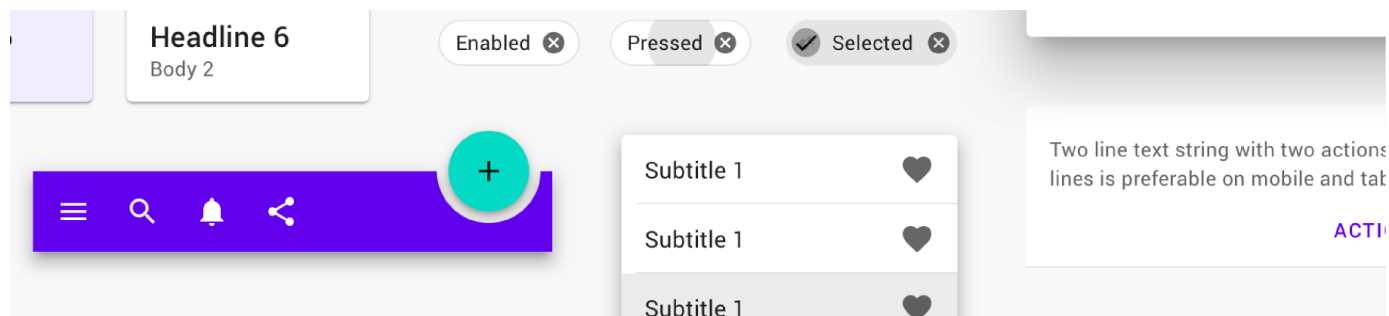

RadioButton

Slider

Switch

Text box

- **Text()** displays a simple text

```
Text(  
    text = "Jetpack Compose",  
    style = MaterialTheme.typography.h4  
)
```

Jetpack Compose

```
Text(  
    text = "سور القرآن الكريم",  
    textAlign = TextAlign.Center,  
    modifier = Modifier.fillMaxWidth(),  
    style = TextStyle(  
        fontWeight = FontWeight.Bold,  
        fontSize = 24.sp,  
        color = Color.Blue,  
        textDirection = TextDirection.Rtl  
    )  
)
```

سور القرآن الكريم

TextField

- **TextField()** collects input from a user. For more styling options, use **OutlinedTextField()**

@Composable

```
fun NameEditor(name: String, onNameChange: (String) -> Unit) {  
    OutlinedTextField(  
        value = name,  
        onChange = onNameChange,  
        label = { Text("Your name") }  
    )  
}
```

Button

```
Button(onClick = {}) {  
    Text("Button")  
}
```

```
OutlinedButton(onClick = {}) {  
    Text("OutlinedButton")  
}
```

```
TextButton(onClick = {}) {  
    Text("TextButton")  
}
```

```
// Search icons @ https://fonts.google.com/icons  
IconButton(onClick = { }) {  
    Icon(  
        Icons.Outlined.Search,  
        contentDescription = "Search",  
    )  
}
```

```
IconButton(onClick = { }) {  
    Icon(painterResource(id = R.drawable.ic_quran), "Quran")  
}
```

Button

OutlinedButton

TextButton

Image

- Displays an image from the res/drawable folder

```
Image(painter =  
    painterResource(R.drawable.img_compose_logo),  
    contentDescription = "Jetpack compose logo",  
    modifier = Modifier.height(300.dp))
```

Other Basic UI Components

- **RadioButton()** allows selecting from multiple choices
- **CheckBox()**

Layouts

Layouts

- Use a Layout to **position** UI elements on the screen
- **Row** - position elements horizontally
- **Column** - position elements vertically
- **Box** - position elements in the corners of the screen or stack them on top of each other

Column

Row

Box

Constraint
Layout

Row & Column Example

- Group multiple basic layouts to create a more complex screen
- Use vertical or horizontal Arrangement to change the position of elements inside the Row or Column

```
@Composable
fun ArtistCard(artist: Artist) {
    Row(verticalAlignment = Alignment.CenterVertically) {
        Image(/*...*/)
        Column {
            Text(artist.name)
            Text(artist.lastSeenOnline)
        }
    }
}
```

Alfred Sisley

3 minutes ago

Box Example

```
@Composable
fun ArtistAvatar(artist: Artist) {
    Box {
        Image(/*...*/)
        Icon(/*...*/)
    }
}
```

Box Example (1 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {  
    Column(  
        modifier = Modifier  
            .padding(16.dp)  
            .fillMaxWidth()  
    ) {  
        Text("Column Text 1")  
        Text("Column Text 2")  
  
        Row(  
            modifier = Modifier.fillMaxWidth(),  
            horizontalArrangement = Arrangement.SpaceEvenly  
        ) {  
            Text(text = "Row Text 1")  
            Text(text = "Row Text 2")  
        }  
    }  
    Text(  
        "Stack Text",  
        modifier = Modifier  
            .align(Alignment.TopEnd)  
            .padding(end = 16.dp, top = 16.dp)  
    )  
}
```

Box Example (2 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {  
    Column(  
        modifier = Modifier  
            .padding(16.dp)  
            .fillMaxWidth()  
    ) {  
        Text("Column Text 1")  
        Text("Column Text 2")  
  
        Row(  
            modifier = Modifier.fillMaxWidth(),  
            horizontalArrangement = Arrangement.SpaceEvenly  
        ) {  
            Text(text = "Row Text 1")  
            Text(text = "Row Text 2")  
        }  
    }  
    Text(  
        "Stack Text",  
        modifier = Modifier  
            .align(Alignment.TopEnd)  
            .padding(end = 16.dp, top = 16.dp)  
    )  
}
```

Box Example (3 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {  
    Column(  
        modifier = Modifier  
            .padding(16.dp)  
            .fillMaxWidth()  
    ) {  
        Text("Column Text 1")  
        Text("Column Text 2")  
  
        Row(  
            modifier = Modifier.fillMaxWidth(),  
            horizontalArrangement = Arrangement.SpaceEvenly  
        ) {  
            Text(text = "Row Text 1")  
            Text(text = "Row Text 2")  
        }  
    }  
    Text(  
        "Stack Text",  
        modifier = Modifier  
            .align(Alignment.TopEnd)  
            .padding(end = 16.dp, top = 16.dp)  
    )  
}
```

Box Example (4 of 4)

```
Box(modifier = Modifier.fillMaxWidth()) {  
    Column(  
        modifier = Modifier  
            .padding(16.dp)  
            .fillMaxWidth()  
    ) {  
        Text("Column Text 1")  
        Text("Column Text 2")  
  
        Row(  
            modifier = Modifier.fillMaxWidth(),  
            horizontalArrangement = Arrangement.SpaceEvenly  
        ) {  
            Text(text = "Row Text 1")  
            Text(text = "Row Text 2")  
        }  
    }  
    Text(  
        "Stack Text",  
        modifier = Modifier  
            .align(Alignment.TopEnd)  
            .padding(end = 16.dp, top = 16.dp)  
    )  
}
```

Surface & Card

- A **Surface** can hold only one child with an option to add a border and elevation
 - Add a layout inside Surface to position multiple elements
- A **Card** is a just a Surface with default parameters

Responsive Layout

- Use the **weight** modifier in Row and Column layouts:
 - Use **weights** to change the **proportion** of the screen child elements will use
- Modifier.*fillMaxWidth*() fill available width
- Modifier.*fillMaxHeight*() fill available height
- Modifier.*fillMaxSize*() fill available width and height
- Use [Constraint Layout](#) (self-study) for more control for complex scenarios

Modifiers

Modifiers

- Modifiers are used to configure and customize the style (i.e., look) or behavior of UI components
 - **Style** UI element such as colors, borders, paddings, **layout parameters** to control spacing and positioning
 - **Add behavior** to UI elements such as making the element clickable or scrollable
- Several modifiers can be **chained**
 - Each modifier **modifies** the composable and **prepares** it for the next modifier in the chain
 - The **order of modifiers** in the chain matters

Modifiers Chain

- Modifiers can be chained and the order matters!
 - Applied in a sequential way and the order impacts the behavior

```
Text(  
  text = "Hello",  
  modifier = Modifier.padding(16.dp)  
    .background(color = Color.Red)  
)
```

```
Text(  
  text = "Hello",  
  modifier = Modifier.background(color = Color.Red)  
    .padding(16.dp)  
)
```

Another Modifier Example

```
@Composable
fun Greeting(name: String) {
    Column(
        modifier = Modifier.fillMaxSize()
                           .background(Color.Green)
                           .padding(16.dp),
        horizontalAlignment = Alignment.CenterHorizontally,
        verticalArrangement = Arrangement.Center
    ){
        Text(text = "Hello $name!")
        Text(text = "Number of coffees: 0")
    }
}
```

Kt

Surah Card

110. النصر - An-Nasr

Aya count: 3

@Composable

```
fun SurahCard(surah: Surah) {  
    Card (elevation = 10.dp,  
        backgroundColor = if (surah.type == "Medinan") lightGreen else lightYellow,  
        modifier = Modifier  
            .fillMaxWidth()  
            .padding(horizontal = 5.dp)  
            .border(width = 2.dp, color = Color.LightGray, shape = RoundedCornerShape(8.dp))  
    ) {  
        Row (verticalAlignment = Alignment.CenterVertically,  
            horizontalArrangement = Arrangement.spacedBy(4.dp),  
            modifier = Modifier.padding(5.dp)  
        ) {  
            val imgResourceId = if (surah.type == "Medinan") R.drawable.ic_madina  
                                else R.drawable.ic_mecca  
            Image(painter = painterResource(id = imgResourceId),  
                contentDescription = "Surah Type",  
                Modifier.height(50.dp)  
            )  
            Column(verticalArrangement = Arrangement.spacedBy(2.dp)) {  
                Text(text = "${surah.id}. ${surah.name} - ${surah.englishName}")  
                Text(text = "Aya count: ${surah.ayaCount}")  
            }  
        }  
    }  
}
```

State

<https://developer.android.com/jetpack/compose/state>

State

- State = any value that can change overtime
- State variable must be declared as

```
var stateVar by remember { mutableStateOf(default) }
```

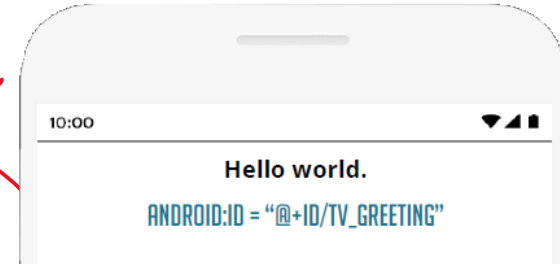

- **Remember** is used to **store** values of state variable in the composition tree (to preserve the values during the recomposition)
 - the stored value is returned during recomposition
- State variable **are observed** by the Jetpack compose runtime
 - Any value changed in the state will trigger the recomposition of any composable functions that **read value**
 - Every place a state variable is displayed is guaranteed to be auto-updated

Imperative UI vs. Declarative UI

- Imperative UI – call a setter on the view to change its internal state

```
TextView greetings = (TextView) findViewById(R.id.tv_greeting)  
greetings.text = "Hello world."
```

- UI in Compose is immutable
 - In compose you cannot access/update UI elements directly (as done in the imperative approach)
 - The only way to update the UI is by updating the state variable(s) used by the UI elements – this triggers automatic UI update
 - E.g., displayed **greeting text** can only be changed by updating the **name** state variable

```
@Composable  
fun WelcomeScreen() {  
    var name by remember { mutableStateOf("Android") }  
    Greeting(name)  
}
```

```
@Composable  
fun Greeting(name: String) {  
    Text(text = "Hello $name!")  
}
```

Recomposition

- When the user interacts with the UI, the UI raises events such as onClick
 - Those events should notify the app logic, which can then change the app's state
 - When the state changes it causes the composable functions to be automatically called again with the new data => this causes the UI elements to be redrawn
 - This process is called **recomposition**
- The Compose framework can intelligently recompose only the components that changed

Recomposition Example

- Every time the button is clicked, the UI raises **onClick** event to notify the app logic, which increments **clicksCount** state variable
- This causes a **recomposition** to take place, i.e., the **ClickCounter** function is automatically called again to redraw the Button

@Composable

```
fun MainScreen() {  
    var clicksCount by remember { mutableStateOf(0) }  
    ClickCounter(clicks = clicksCount, onClick = { clicksCount += 1 })  
}
```

@Composable

```
fun ClickCounter(clicks: Int, onClick: () -> Unit) {  
    Button(onClick = onClick) {  
        Text("I've been clicked $clicks times")  
    }  
}
```

How recomposition works

1. Creates an abstract representation of the UI and renders it
2. When a change occurs, it creates a new representation
3. Computes the differences between the two representations
4. Renders the differences [if any]

For more details about [Jetpack Compose Runtime](#), watch this [video](#)

Stateful versus stateless

- A stateful composable uses **remember** to store an object in the composition tree
 - However, stateful composable tend to be less reusable and harder to test
- A stateless composable that doesn't hold any state
 - The caller controls and manages the state
 - An easy way to achieve stateless is by using **state hoisting**

State Hoisting

- To make a composable stateless, **extract** its state and **move it to the caller** of the composable
- Then **pass the state** to the composable as an immutable parameter, along with a callback function that the UI can call to update that state in response to events (e.g., `onValueChange`, `onExpand` and `onCollapse`):
 - **`name: String`** - the current value to display
 - **`onNameChange: (String) -> Unit`** - a callback that requests the value to change
- Hoisted state can be shared with multiple composables

State Hoisting - Example

```
@Composable
fun HelloScreen() {
    var name by remember { mutableStateOf("") }

    HelloContent(name = name, onNameChange = { name = it })
}

@Composable
fun HelloContent(name: String, onNameChange: (String) -> Unit) {
    Column(modifier = Modifier.padding(16.dp)) {
        Text(
            text = "Hello, $name",
            modifier = Modifier.padding(bottom = 8.dp),
            style = MaterialTheme.typography.h5
        )
        OutlinedTextField(
            value = name,
            onValueChange = onNameChange,
            label = { Text("Name") }
        )
    }
}
```

Unidirectional Data Flow

= a design where **state flows down** and **events flow up**

State flows down via function parameters

(i.e., name)

(State change)

Events flow up via callback functions

(i.e., onNameChange)

By hoisting the state out of HelloContent, it can be **reused** in different situations, and it is easier to test

Summary

- Declarative UI is the trend for UI development
- UI is composed of small reusable components
- UI Component = Composable function
 - just a function annotated with `@Composable`
- Layout are used to position UI elements
- UI in Compose is immutable
 - It only accepts state & exposes events
 - Unidirectional data flow pattern:
 - State flows down via parameters
 - Events flow up via callbacks
